AG LF series

low fouling brackish water reverse osmosis elements

The A-Series LF proprietary thin-film reverse osmosis (RO) membrane elements are characterized by high flow, high sodium chloride rejection and low fouling surface properties. AG LF brackish water elements are selected when high rejection and operating pressures as low as 200 psi (1,379 kPa) are desired. These elements are recommended for brackish water with salt concentration (TDS) levels between 1,000 and 10,000mg/l or when very high salt rejection of monovalent ions is required.
